

Magnetic clamp MK4

The MK 4 magnetic clamp is used to attach shuttering profiles to steel formwork. They are used for shuttering balcony upstands, wall and ceiling end formwork as well as door and window recesses. The standpipe is inserted into the magnetic element and can be pulled out. This makes it possible to remove the surface of the concrete component without hindrance. Profiles up to a width of 250 mm can be clamped in the magnetic clamp. The standpipes can also be supplied in a higher version on request.
