

Round profile

The round profile is a surface spacer and is used in precast plants and in the area of floor slabs with horizontal reinforcement. The round contact surface is suitable for transferring loads over a large area into the substrate. The round profile is stable and has a good load-bearing capacity. It is suitable for use with medium-weight reinforcement and where high traffic loads occur. Quick installation is guaranteed. It is also possible to produce the round profiles in short pieces in accordance with the DBV spacer leaflet (L<350 mm).
